Oil Management System

The function of oil management system

A proper oil management system is essential to ensure compressor lubrication and energy efficient cooling. An oil management system is a cost effective alternative to replace expensive compressors due to incorrect lubrication. If selected and installed correctly, an oil management system will give years of trouble free operation, protecting the compressors from both low and excess oil levels, with little or no maintenance. Excessive oil within the system can lead to a slug of oil returning to the compressor. A slug of oil can be some damaging to a compressor as a slug of liquid refrigerant.

By moving oil from the discharge gas, the system efficiency is increased. Oil in a refrigeration or air conditioning system reduces the efficiency of the system by:

- 1. A reduction in heat transfer due to oil coating of the condenser and evaporator walls
- 2. Displacing refrigerant volume resulting in an system mass flow
- Oil management system components
- Oil Separator / Oil Reservoir / Oil Level Regulator / Oil Differential Check Valve / Oil Filter

Fixed Oil Level Regulator

The **PROLC-2** oil level regulator controls the oil level in the compressor crankcase with a float operated valve. The regulator maintains the oil level in the compressor crankcase at 1/2" sight glass. If lower than this level, the float operated valve will open and fill the oil from oil receiver by automatic. If it in the right oil level, the valve will close and stop filling oil. This can keep the compressor running correctly.

Adjustable Oil Level Regulator

The **PROLC-2-5** adjustable oil level regulator allows the oil in the compressor crankcase to be maintained at any level between 1/4" and 1/2" sight glass The **PROLC-2-5** maintains the level at any pressure differential between 5 and 90psi. If the oil level in the crankcase is too low, the level can be adjusted by turning the adjustment screw on top of the regulator. This can be done while the systemis in operation. Poly Run exclusive design eliminates the need of shuting down the system and disconnecting the oil feed lines in order to adjust the regulator.

PROLC-2

PROLC-2-5 / PROLC-2-5E

Model	Oil Level Sight Glass	Equalization Suitable with Connection R717&HP		Differential Pressure	Max.Working Pressure	Connection Size

PROLC-2-5E	1/4" to 5/8" Adjustable	3/8"SAE	No	0.35-6.2bar	31bar	7 Bolts

Automotive Oil Separator

During the compressor operating, the outlet line always has a lot of refrigeration oil. In order to ensure the compressor not lose too much refrigeration oil influence heating function of the condenser and cooling function of evaporator. So, between compressor and condenser, it must install one oil separator. It can separate the refrigeration oil and medium. And let the oil go back to compressor automatically and achieve the best cooling result

Oil Separator / Demountable Oil Separator

When compressor is in operation, the outlet of compressor always has lots of refrigeration oil. We need to install an oil separator between compressor and condenser to separate the refrigeration oil and refrigerants in order to prevent the compressor not lose too much refrigerant oil and prevent refrigerant oil flow to system with refrigerants to interfere the condenser's heat function and evaporator cooling function. Then the oil will flow back to the compressor crankcase. Oil-return device operates on the ball valve moving on the bottom of oil separator and the sufficiency of oil in compressor and let the compressor reach its best cooling performance

We need to pre-charge the oil before installing oil separator. The oil we charged should be same as the oil in the compressor crankcase

Helical Oil Separator

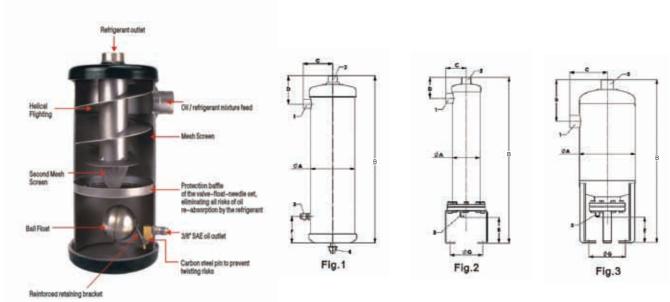

The helical oil separator features a centrifugal flow path achieving approximately 99% efficiency of oil separation with low pressure drop. Testing by an independent laboratory found that only 0.006% oil by volume was being discharged into the system after leaving a helical oil separator. Poly Run helical oil separator can help to reduce the vibration and noise that caused by compressor. While the parallel compressor system in unloading energy or changing, it still can keep the high oil separation efficiency, because of special design by poly Run for the helical flighting

Installation

Before installing the oil separator, oil pre-charge is required. The charging oil should be kept on above of the oil tank. To pre-charge the oil is very important, this can avoid damaging the needle valve. And the oil we charged must be same as that in the crankcase. The oil separator should be installed on the outlet line which between the compressor and condenser

Note

A check valve should be located downstream of the outlet connection. to prevent liquid refrigerant migrating from the condenser, and with properly pipe disposed. The oil separator must be installed vertically. Proper piping practice should be adopted to prevent excessive loads or vibration at the inlet and outlet connections

Oil Storage Separator

Oil storage separator is used on parallel screw compressor. It can achieve very good oil separation purpose in the lowest pressure drop. It can store the separated oil in the bottom of the vessel, and will send the oil to each compressor crankcase by the electronic oil level regulator relyed with pressure differential

Feature

- 1. With oil receiver inside, do not need to add a separated oil storage. It saved a lot of time and material, also reduced the leaking problem
- 2. It can help to reduce the vibration and noise that caused by compressor
- 3. It needs to add the electronic oil level regulator to replace the check valves
- 4. Max. Working Pressure: 3.0 MPa
- 5. Higher efficiency oil separation
- 6. Compatible with all CFC, HCFC and HFC refrigerants and related oils

Differential Check Valve

PRV-20 Differential check valve is situated on the 3/8"SAE connector on the top of the oil receiver. It can release the pressure from oil receiver to suction pipes, so that it can keep the pressure to a fixed number. If there is enough oil in the oil receiver, then differential check valve will ensure the oil to flow from oil receiver to oil regulator.

Pressure differentia initialization: 20psi (1.38bar)

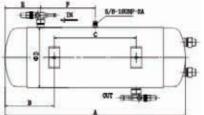

Oil Receiver

Due to system design, loads & defrost cycles, varying amounts of oil can be returned by the oil separator. So a safety reserve of oil is required for the operation of our oil control system. The oil receiver is the holding vessel for this stand-by oil. It has sight glass ports to observe the oil inside the vessel. The vavle on top of the oil receiver receives oil from the oil separator, and the bottom valve distributes oil to the oil regulator. The valves are back seating and have a 1/4"SAE connection, allowing the addition or removal of oil from the receiver. High pressure gas returns with the oil from the oil separator to the oil receiver. Pressure could increase in the oil receiver to adversely affect the oil regulators. To prevent this, a vent line is installed from the top of the oil receiver to the suction line. This line permits the pressure in the oil receiver to be approximately the same as suction line and the compressor crankcase

Feature

- 1. Nine sizes available in both standard and high pressure ranges
- 2. Robust construction
- 3. Sight glass with floating ball
- 4. Standard models supplied with mounting brackets
- 5. Premium quality O-ring seats

Oil Filter

PRG Series oil filter can filtrate 99% of 3 micron grain but still have enough flow rate to maintain the flow pressure drop. PRG series oil filter has a very high capacity of filtration. It can return the cleanness POE oil and mineral oil back to the compressor. The clean oil not only can make sure the oil regulator working properly but also can reduce the abrasion of the compressor. PRG series oil filter actually can release changing oil for compressor that caused by suspend feculence during the working
